

Intelligence at work

David Spurway

IBM Power Systems CTO, UK & Ireland

Session Objectives

- You don't need to be an expert to do this. Anyone can cook with these ingredients!
- What started me on this journey and initial learning you can also use.
- My first creation was to answer a Frequently Asked Question. What FAQs do you see?
- The initial ingredients I used - Python, Beautiful Soup, Jupyter and Anaconda
- Lots of options available, so choose what works for you
- Node-RED is a powerful mixing bowl and IBM Watson Assistant can be the icing on the cake
- A quick taste of IBM Sales Manual Assistant
- My next bake brings in AIX, Db2 and James Bond!
- My first “Showstopper” is still to come
- What could you cook up?

Baking with IBM Watson Assistant, Node-RED, Bond Films and more!

David Spurway

IBM Power Systems CTO, UK & Ireland

2019 IBM Systems Technical University

Wednesday 23rd October 2019

Florenc 2-Mezzanine

What is the Great British Bake Off?

- “So we’ve got this fat Scouser and we’ve got this posh lady from down south and we’ve got a couple of comedians that haven’t been on the TV for a while and we stick them in a tent with 12 bakers.”
- “a show so popular that only England football matches compete with it for viewing figures”
- “a peak of 14.5m people, the largest TV audience of 2015, tuned in to watch [Nadiya Hussain win](#)”
- “It appeals to children, grannies, workers, everybody, because it’s gentle.”
- “sales of flour and cooking chocolate boom each time a new series starts”

I am not Paul Hollywood

“**Paul John Hollywood** (born 1 March 1966) is an English [celebrity chef](#) and television presenter, best known for being a judge on [The Great British Bake Off](#) since 2010.

He began his career at his father's bakery as a teenager and went on to serve as head baker at a number of hotels around Britain and internationally.

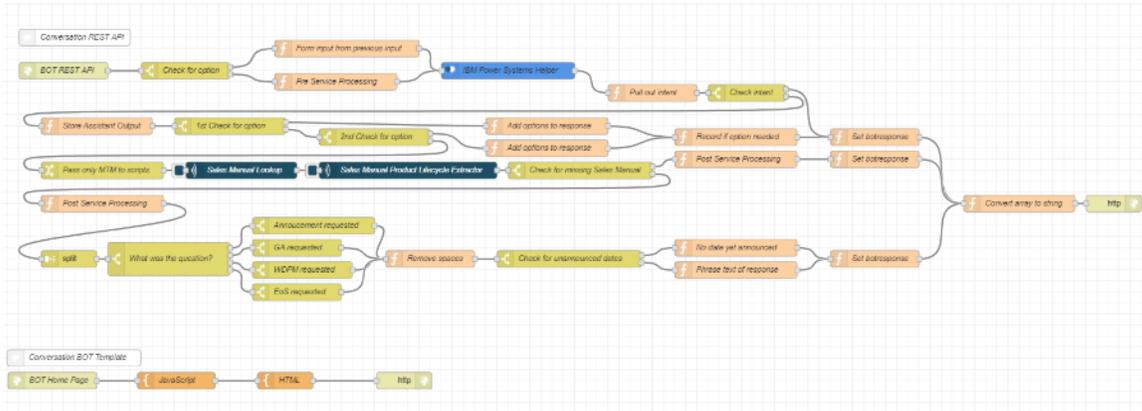

- *100 Great Breads* (2004) Cassell, London [ISBN 978-1-8440-3700-1](#)
- *How to Bake* (2012) Bloomsbury [ISBN 978-1-4088-1949-4](#)
- *Paul Hollywood's Bread* (2013) Bloomsbury, London [ISBN 978-1-4088-4069-6](#)
- *Paul Hollywood's Pies and Puds* (2013) Bloomsbury, London [ISBN 978-1-4088-4643-8](#)

Anyone can bake

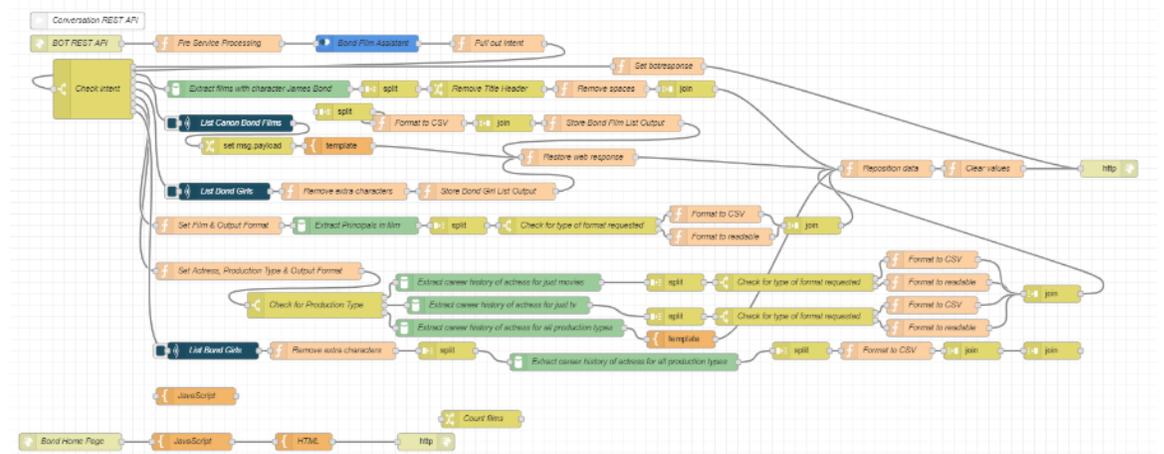

What have I baked so far?

IBM Sales Manual Assistant

James Bond Assistant

In my first “bake”, answering an FAQ

- I wrote a blog entitled “Those older IBM Power Systems were great, but the time has come to move up to POWER9!”
- <https://www.linkedin.com/pulse/those-older-ibm-power-systems-were-great-time-has-come-david-spurway/>
 - Majority of POWER5-based IBM iSeries & pSeries servers will reach End of Service 31/12/2019
 - Majority of POWER6-based IBM System i & System p servers reached End of Service 31/03/2019
 - Majority of POWER7-based IBM Power System servers will reach End of Service 30/09/2019

David Spurway

@D_Spurway

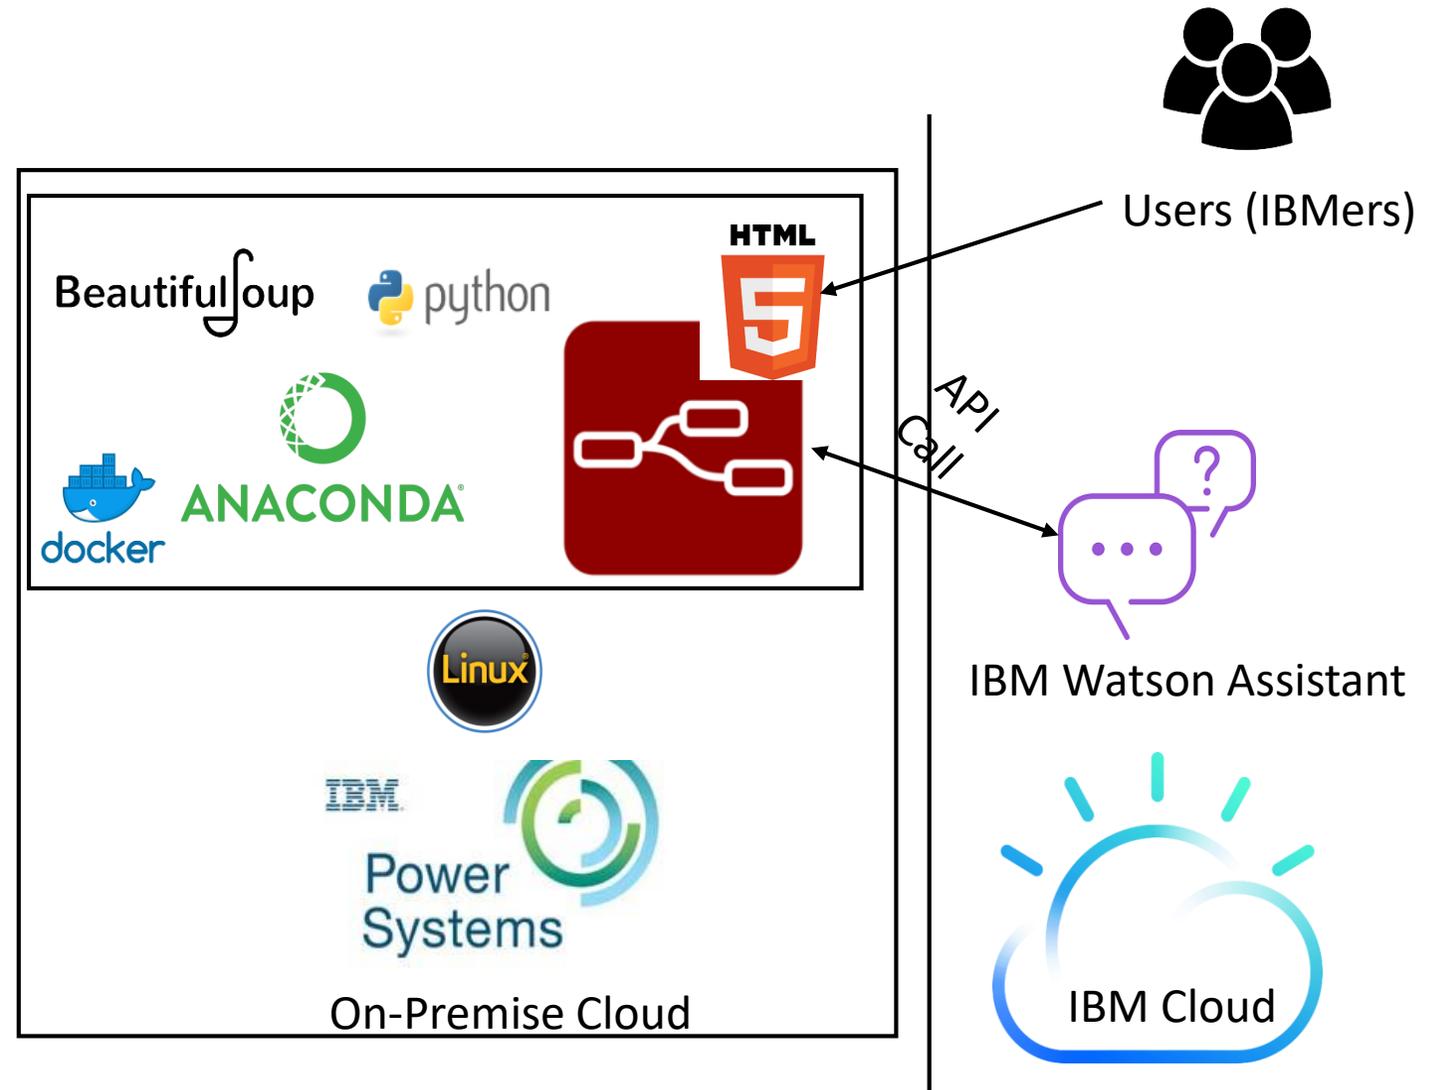

Announced today, the End of Support for POWER7+ based @IBMPowerSystems & Power 795s will the end of 2020. Another reason to upgrade to POWER9! www-01.ibm.com/common/ssi/Sho...

9:01 AM · Oct 1, 2019 · [Twitter Web App](#)

The high level recipe for the IBM Sales Manual Assistant

A Hybrid Cloud solution with AI

- Running in a Docker Container on Centos on IBM Power
- Anaconda to handle compatibility issues
- Node-RED calls
 - Watson Assistant
 - Python
 - BeautifulSoup
 - Urllib
- Users interact with a webpage, which is part of Node-RED

My first new ingredients

“Python is an interpreted, object-oriented, high-level programming language with dynamic semantics.”

“Beautiful Soup is a Python library for pulling data out of HTML and XML files.”

BeautifulSoup

Dough needs a rest, Python is easy with a Notebook

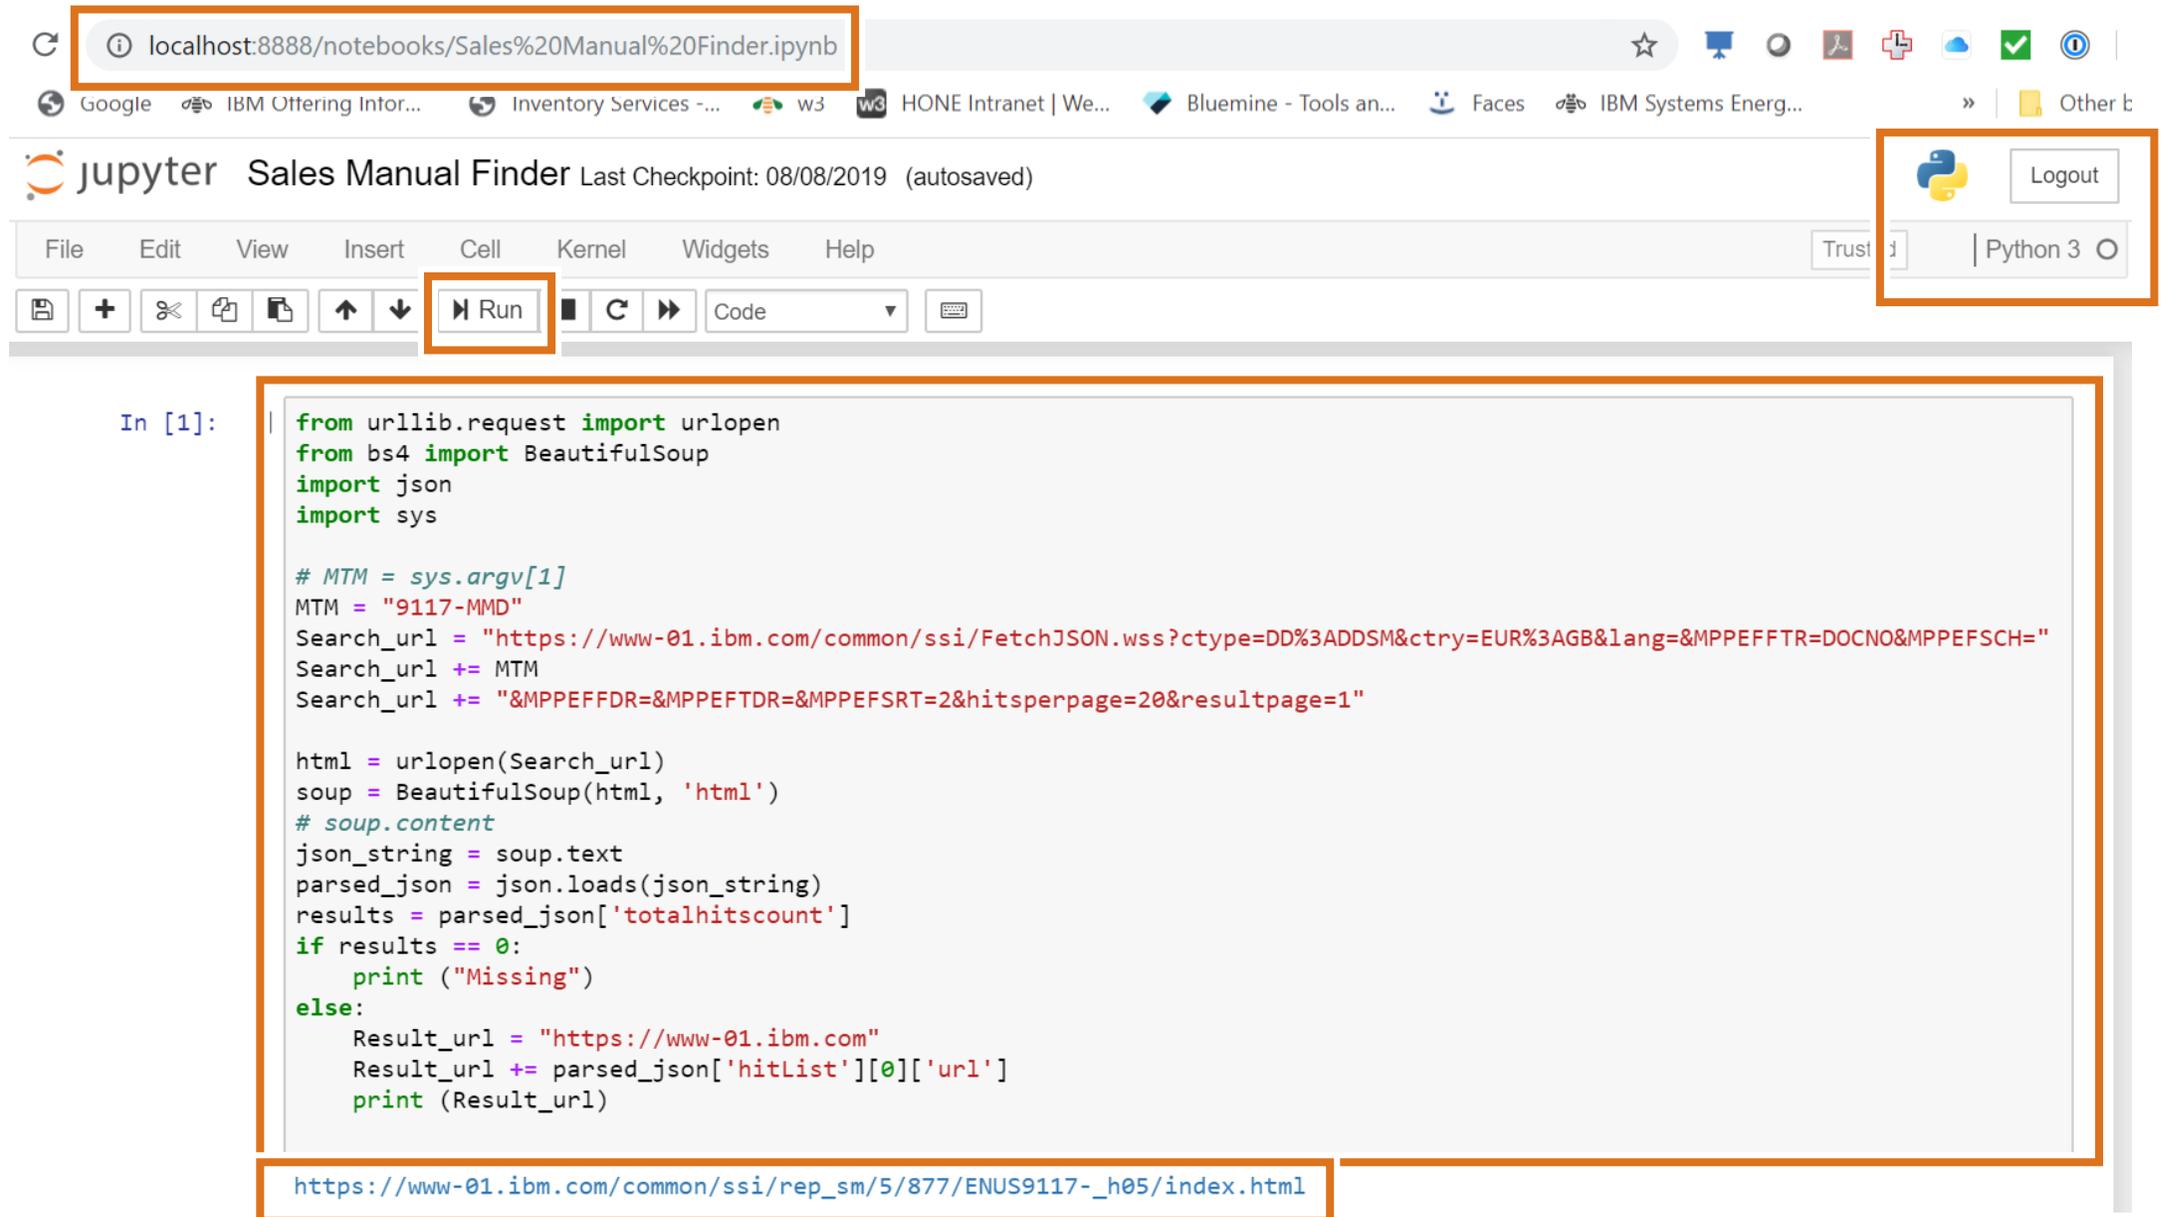

“Project Jupyter exists to develop open-source software, open-standards, and services for interactive computing across dozens of programming languages.”

“Anaconda is a free and open-source distribution of the Python and R programming languages for scientific computing, that aims to simplify package management and deployment.”

Get ready to bake with Jupyter Notebook

The screenshot shows a web browser window displaying a Jupyter Notebook. The address bar shows the URL `localhost:8888/notebooks/Sales%20Manual%20Finder.ipynb`. The notebook title is "Sales Manual Finder" with a last checkpoint of "08/08/2019 (autosaved)". The interface includes a menu bar (File, Edit, View, Insert, Cell, Kernel, Widgets, Help) and a toolbar with icons for file operations and execution. The "Run" button is highlighted with an orange box. The code cell contains Python code for fetching and parsing data from an IBM website. The output of the code is a URL: `https://www-01.ibm.com/common/ssi/rep_sm/5/877/ENUS9117-_h05/index.html`, which is also highlighted with an orange box. The top right corner of the notebook interface shows a Python logo, a "Logout" button, and the kernel name "Python 3".

```
In [1]:  
from urllib.request import urlopen  
from bs4 import BeautifulSoup  
import json  
import sys  
  
# MTM = sys.argv[1]  
MTM = "9117-MMD"  
Search_url = "https://www-01.ibm.com/common/ssi/FetchJSON.wss?ctype=DD%3ADDSM&ctry=EUR%3AGB&lang=&MPPEFFTR=DOCNO&MPPEFSCH=" +  
Search_url += MTM  
Search_url += "&MPPEFFDR=&MPPEFTDR=&MPPEFSRT=2&hitsperpage=20&resultpage=1"  
  
html = urlopen(Search_url)  
soup = BeautifulSoup(html, 'html')  
# soup.content  
json_string = soup.text  
parsed_json = json.loads(json_string)  
results = parsed_json['totalhitscount']  
if results == 0:  
    print ("Missing")  
else:  
    Result_url = "https://www-01.ibm.com"  
    Result_url += parsed_json['hitList'][0]['url']  
    print (Result_url)
```

https://www-01.ibm.com/common/ssi/rep_sm/5/877/ENUS9117-_h05/index.html

What I baked first combined Technical and Signature

A little bit of Python, calling BeautifulSoup:

```
from urllib.request import urlopen
from bs4 import BeautifulSoup
import sys

url = sys.argv[1]
if url == "Missing":
    print("Missing")
else:
    html = urlopen(url)
    soup = BeautifulSoup(html, 'html')

    Product_Life_Cycle_Table = soup.find("table", {"id": "Product_Life_Cycle_Table"})
    Product_Life_Cycle_Table = Product_Life_Cycle_Table.find_next("table")
    Available = Available.find_next("td")
    WDFM = WDFM.find_next("td")
    EOS = EOS.find_next("td")

    print("\n",EOS.get_text())
```

Work out which server is being talked about

Example:

Maybe we are talking about the IBM Power 770, but there are three different versions of that server with different dates

Find the right “Sales Manual” page for the server

- [Europe - IBM Power 770 Server MMB](#)
- [Europe - IBM Power 770 POWER7 Server \(9117-MMC\)](#)
- [Europe - IBM Power 770 POWER7+ Server \(9117-MMD\)](#)

Read the dates from the table in the Sale Manual

Family 9117+04 IBM Power 770 POWER7 Server (9117-MMC)
IBM Europe Sales Manual
Revised: January 22, 2019.

Table of contents

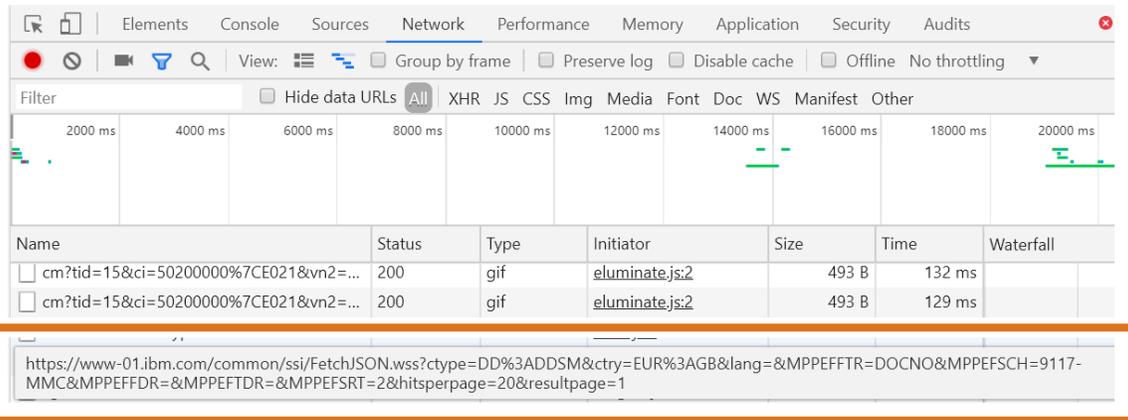

- ↓ Product life cycle dates
- ↓ Abstract
- ↓ Highlights
- ↓ Description
- ↓ Reliability, availability, and serviceability (RAS)
- ↓ Models
- ↓ Technical description
- ↓ Publications
- ↓ Features
- ↓ Accessories
- ↓ Supplies

Product life cycle dates

Type Model	Announced	Available	Marketing Withdrawn	Service Discontinued
9117-MMC	2011/10/12	2011/10/21	2015/01/06	2019/09/30

A complication to the bake

Thanks to Ross Cruickshank for pointing me at the JSON being sent by the search, which can be accessed directly:

Unfortunately, the URLs for the Sale Manuals can change, there are sometimes duplicates and can even be missing

The page used to search is dynamic, so BeautifulSoup can't directly parse the results

Oops — that's not right!

The page you are trying to access has either been moved or deleted.

```
</div>
<div class="ibm-rule"></div>
<div class="ibm-fluid" id="hitlist">
</div>
<div class="ibm-fluid">
<div class="ibm-col-12-5">
</div>
<div class="ibm-col-12-2" id="spinner-module">
```

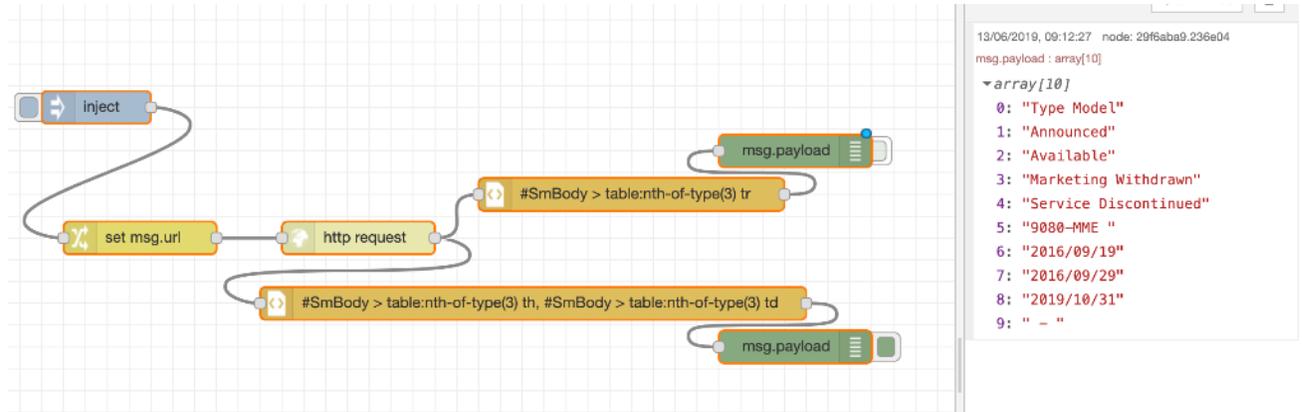

Inspecting my page, I can see my result, but...

```
<div class="ibm-fluid" id="hitlist">
  <div class="ibm-col-12-5" id="result">
    <a class="ibm-h5 ibm-bold" target="_blank" href="/common/ssi/ShowDoc.wss?docURL=/common/ssi/rep_sm/2/877/ENUS9080-_h02/index.html&request_locale=en">
      <span>EMEA - IBM Power E870C Enterprise server Model MME</span> == $0
    </a>
    <br>
    <span class="ibm-small ibm-bold ibm-textcolor-gray-30">Published: </span>
    <span class="ibm-date-time ibm-small ibm-bold ibm-textcolor-gray-50">21 May, 2019</span>
    <span class="ibm-small ibm-bold ibm-textcolor-gray-30"> | Document Number: </span>
    <span class="ibm-small ibm-bold ibm-textcolor-gray-50">M9080+02</span>
  </div>
</div>
```

You choose the ingredients you want to use

I could have used pure Node-RED, without Python, as shown by Ross. That could have been usable directly in the IBM Cloud, as a Service.

But, the page I am working with has unhelpful HTML and it was a lot less clear how to do it and maintain.

The ingredients I liked the taste of were Python and Json

My little Python script to find the Sales Manual(s) for a given Machine Type/Model, if it exists.

```
#!/usr/bin/env python
# coding: utf-8

from urllib.request import urlopen
from bs4 import BeautifulSoup
import json
import sys

MTM = sys.argv[1]

Search_url = "https://www-01.ibm.com/common/ssi/FetchJSON.wss?ctype=DD%3ADDSM&ctry=EUR%3AGB&lang=&MPPEFFTR=DOCNO&MPPEFSCH="

Search_url += MTM
Search_url += "&MPPEFTR=DOCNO&MPPEFSCH="

html = urlopen(Search_url)
soup = BeautifulSoup(html, 'html')

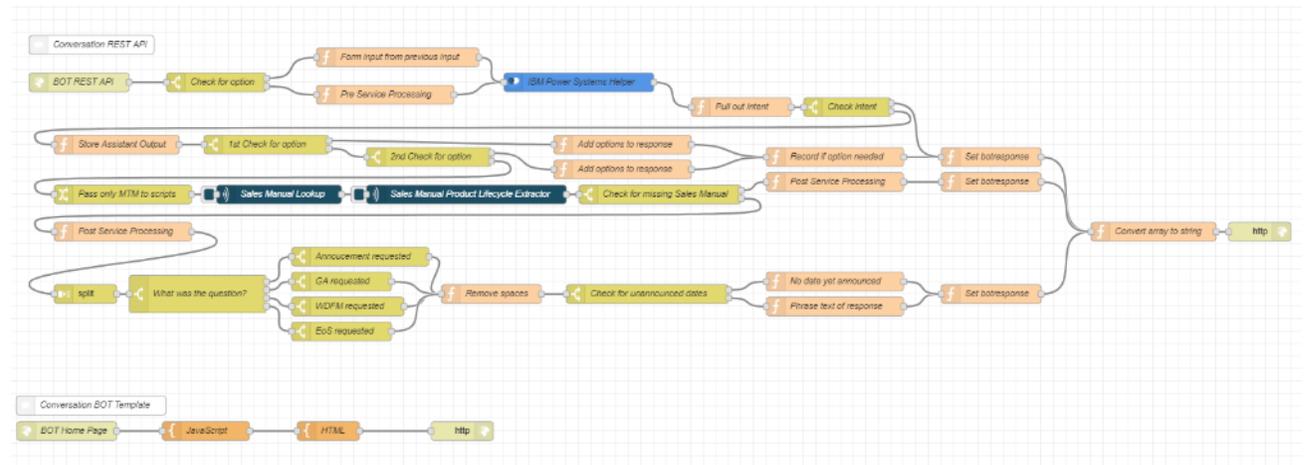

json_string = soup.text
parsed_json = json.loads(json_string)

print ("Missing")

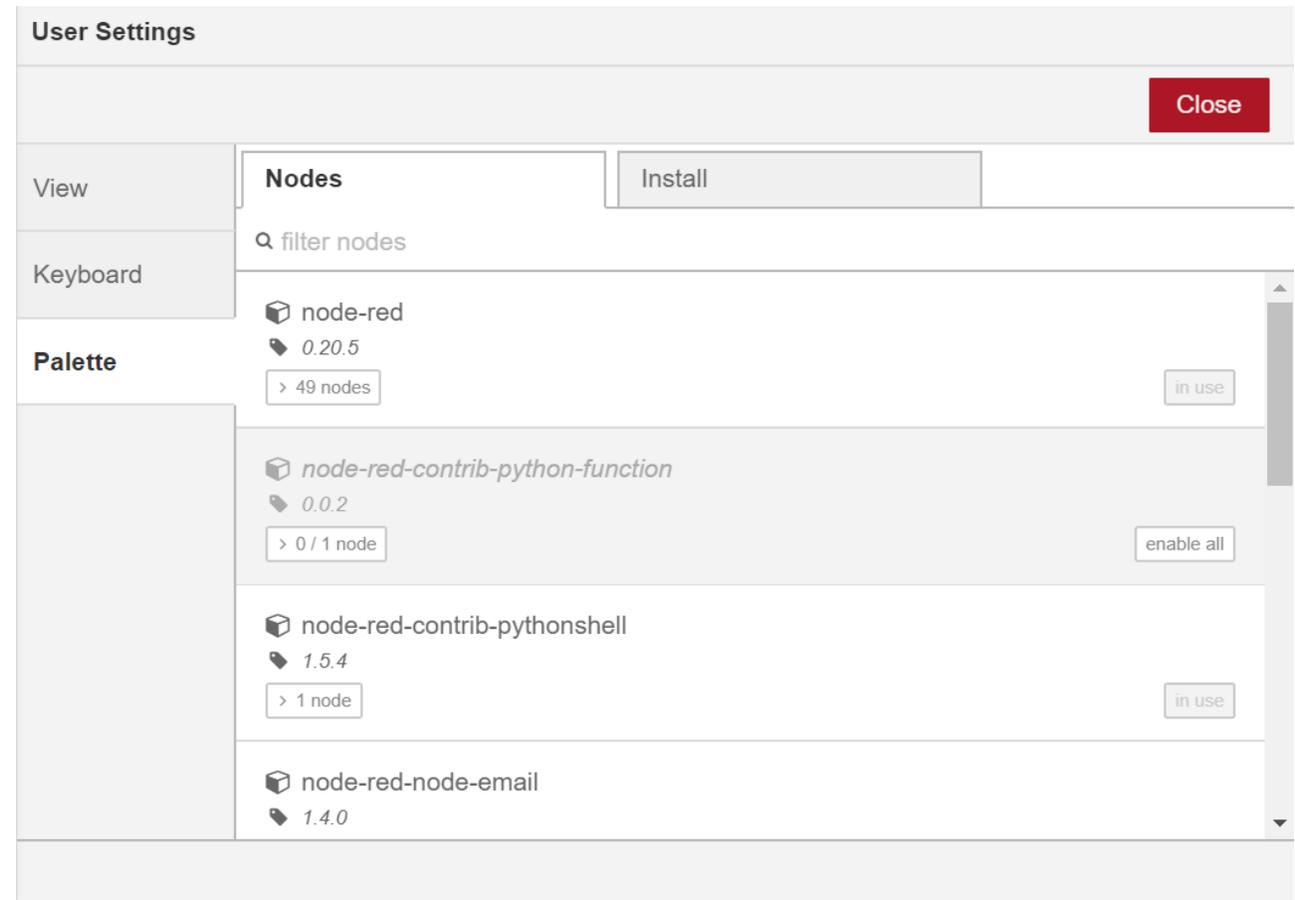

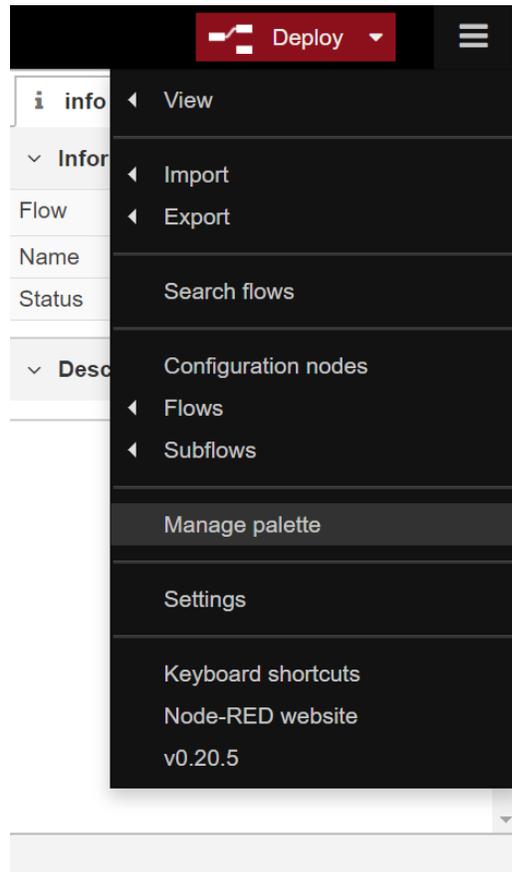

Result_url = " https://www-01.ibm.com"
Result_url += parsed_json['hitList'][0]['url']
print (Result_url)
```

Move to the Node-RED Mixing Bowl

- Simple flow at the bottom creates the webpage
- Top flow detects input on the page, passes it to IBM Watson Assistant, which works out the MTM and the question
- Python scripts find the answer, and we return the result

Adding my Python ingredient to Node-RED

The icing on the cake is IBM Watson Assistant

- I built an IBM Watson Assistant to identify which server we are talking about.
- 10,000 Free Messages/Month

The screenshot displays the IBM Watson Assistant management console. At the top, there is a dark header with the text 'IBM Watson Assistant'. Below this, there are two tabs: 'Assistants' and 'Skills', with 'Skills' being the active tab. The main content area is titled 'IBM Power Systems Helper' and includes a subtitle: 'Example Watson Assistant to help David Spurway learn and answer some of the most commonly asked questions.' Below this, there is a section for 'Skill' with a description: 'A dialog skill provides specific responses you've created. Choose one for your assistant. [Learn more](#)'. Underneath, there is a 'Dialog' section containing a card for the 'IBM Power Systems Identifier' skill. The card has a title, a description 'Identify which IBM Power System or earlier server we are looking at', and a table of metadata. The table has five columns: LANGUAGE, TRAINED DATA, VERSION, CREATED, and UPDATED. The data row shows 'English (US)', '3 Intents | 7 Entities | 77 Dialog Nodes', 'Development', '21 Mar 2019 03:53 GMT', and '17 Jun 2019 17:34 BST'. At the bottom of the card, it says 'LINKED ASSISTANTS (1): IBM Power Systems Helper'.

Catering for different tastes

- I came up with a range of ways to say the same thing.
- Then I had my friend test it.
- It broke, as she used other words that I had not thought of.
- So I added them.

The screenshot shows a web-based interface for defining an entity. At the top, there is a field for 'Entity name' with the value '@Lifecycle_date' and a 'Fuzzy Match' option. Below this is a 'Value name' field with the placeholder 'Enter value'. To the right of the value name field is a 'Synonyms' dropdown menu and an 'Add synonym...' button with a plus icon. Below the value name field are two buttons: 'Add value' and 'Show recommendations'. The interface is divided into two tabs: 'Dictionary' and 'Annotation BETA'. The 'Dictionary' tab is active, showing a table of entity values and their synonyms.

<input type="checkbox"/>	Entity values (4) ▼	Type	
<input type="checkbox"/>	Announcement	Synonyms	Announced, Introduced
<input type="checkbox"/>	EoS	Synonyms	End of Support, End of Service, Service Discontinued, Unsupported, Not supported, No longer supported, End of life
<input type="checkbox"/>	Generally Available	Synonyms	Available, GA
<input type="checkbox"/>	Withdrawn from Marketing	Synonyms	Sold, WDFM, Withdrawn, still buy, purchase, stop selling

Powerful flexibility to allow eating in many ways

Welcome
 welcome or #Greeting
 1 Response / 0 Context set / Does not return

4	@Machine_Type	\$Machine_Type	Enter a prompt	Optional		
5	@Machine_Model	\$Machine_Model	Enter a prompt	Optional		
6	@Server_MTM	\$Server_MTM	Please tell me the I	Required		

Layers in IBM Watson Assistant

The screenshot displays the IBM Watson Assistant interface for the 'IBM Power Systems Identifier' bot. The top navigation bar includes 'Assistant /', 'IBM Power Systems Identifier' (with a 'Version: Development' badge), and a description: 'Identify which IBM Power System or earlier server we are looking at'. Below this are tabs for 'Intents', 'Entities', 'Dialog' (selected), 'Options', 'Analytics', 'Versions', and 'Content Catalog'.

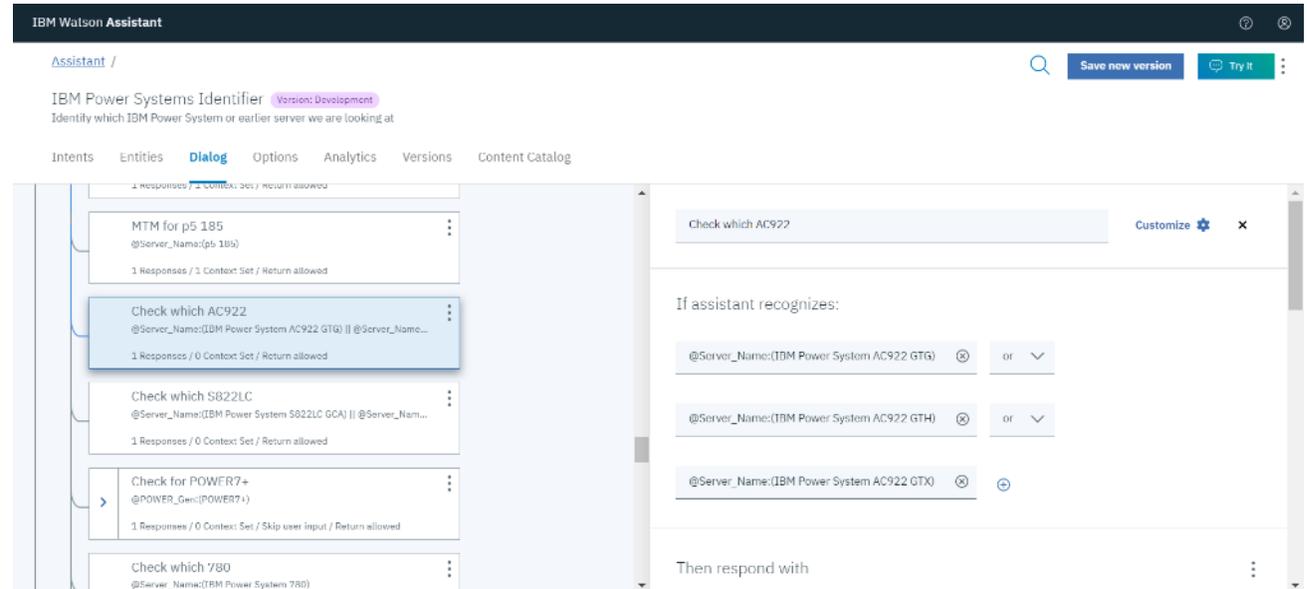

The 'Dialog' tab shows a flowchart for the 'IBM Power Systems Identifier' bot. The flow starts with a 'Welcome' node, followed by a 'Check a date for an IBM Power System by MTM' node (highlighted with a blue box and a checkmark). This node has a condition '#Check_Date' and a note 'Skip user input and evaluate child nodes'. Below this node are two child nodes: 'Check for full MTM' and 'MTM for E980'. Each node shows its configuration, including response count, context set, and return status.

- Welcome**: welcome || #Greeting. 1 Responses / 0 Context Set / Does not return.
- Check a date for an IBM Power System by MTM**: #Check_Date. 1 Responses / 7 Context Set / 7 Slots / Skip user input / Does not r...
- Check for full MTM**: @Server_MTM && @Lifecycle_date. 1 Responses / 1 Context Set / Return allowed.
- MTM for E980**: @Server_Name:(IBM Power System E980). 1 Responses / 1 Context Set / Return allowed.

- In IBM Watson Assistant, we step down through the nodes until a condition is met, then we process that node.
- To begin, a welcome, where I explain what the bot can do so far.
- Then, capture the kind of date we are looking for, and a range of other details like MTM and/or Server Name.
- If the MTM is provided, we just pass that to Node-RED. Or, if the name is unique, translate that to the right MTM, and pass that through.

Some more challenges in the bake

- If the name could be more than one MTM, we need to ask the question back to find out which one.
- Then, on the second time back into Watson Assistant, the MTM is presented and we go through nice a easily.

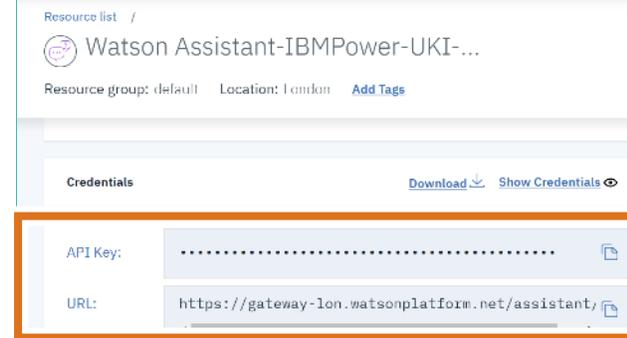

Some ingredients mix together easily

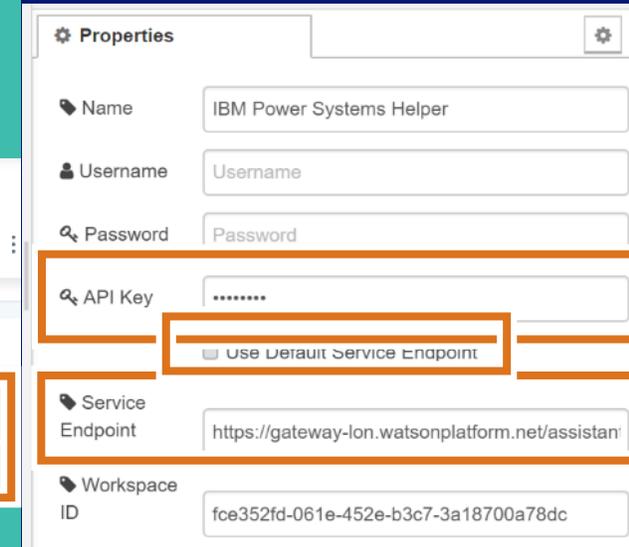

Linking the Watson Assistant Node, through the API Key and URL, results in the Intents, Context and text responses from IBM Watson Assistant just flowing into Node-RED.

One mistake I made was leaving the “Use Default Service Endpoint” clicked, but once past that, this part was very easy!

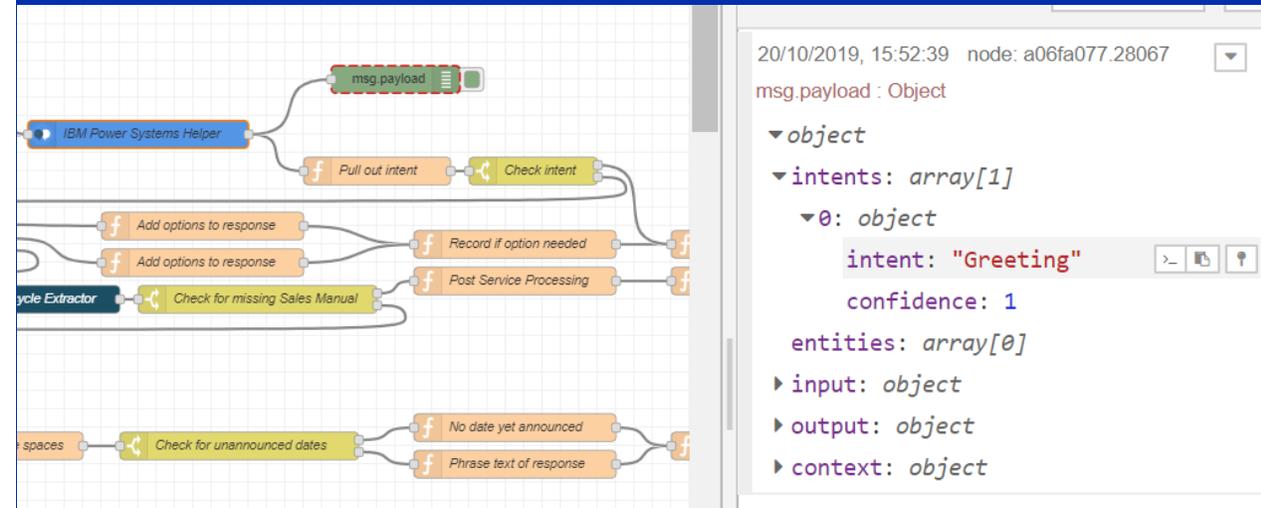

Get the API Key and URL from Resource List of IBM Watson Assistant

Paste into node

Context and Intents just flow into Node-RED

A quick taste of IBM Sales Manual Assistant

Find out more by checking on Github here:

<https://github.com/DSpurway/DIS-IBM-Power-Hybrid-Cloud>

My next bake brings in AIX, Db2 and James Bond!

The question I thought I would look at this time is
The Curse Of The Bond Girls

https://jamesbond.fandom.com/wiki/Bond_girl_curse

"My agent told me, 'If you take that role you'll never work again'. But what movie could you do that they'd still be interviewing you for 20 years later?"

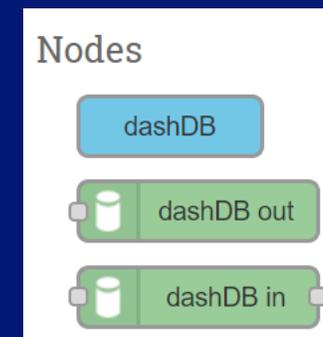

— Lynn-Holly Johnson

We want to include AIX
& IBM i in the mix!

SQL on AIX accessed
with DashDB Node

<https://flows.nodered.org/node/node-red-nodes-cf-sqldb-dashdb>

Some fun data from the Internet Movie Database

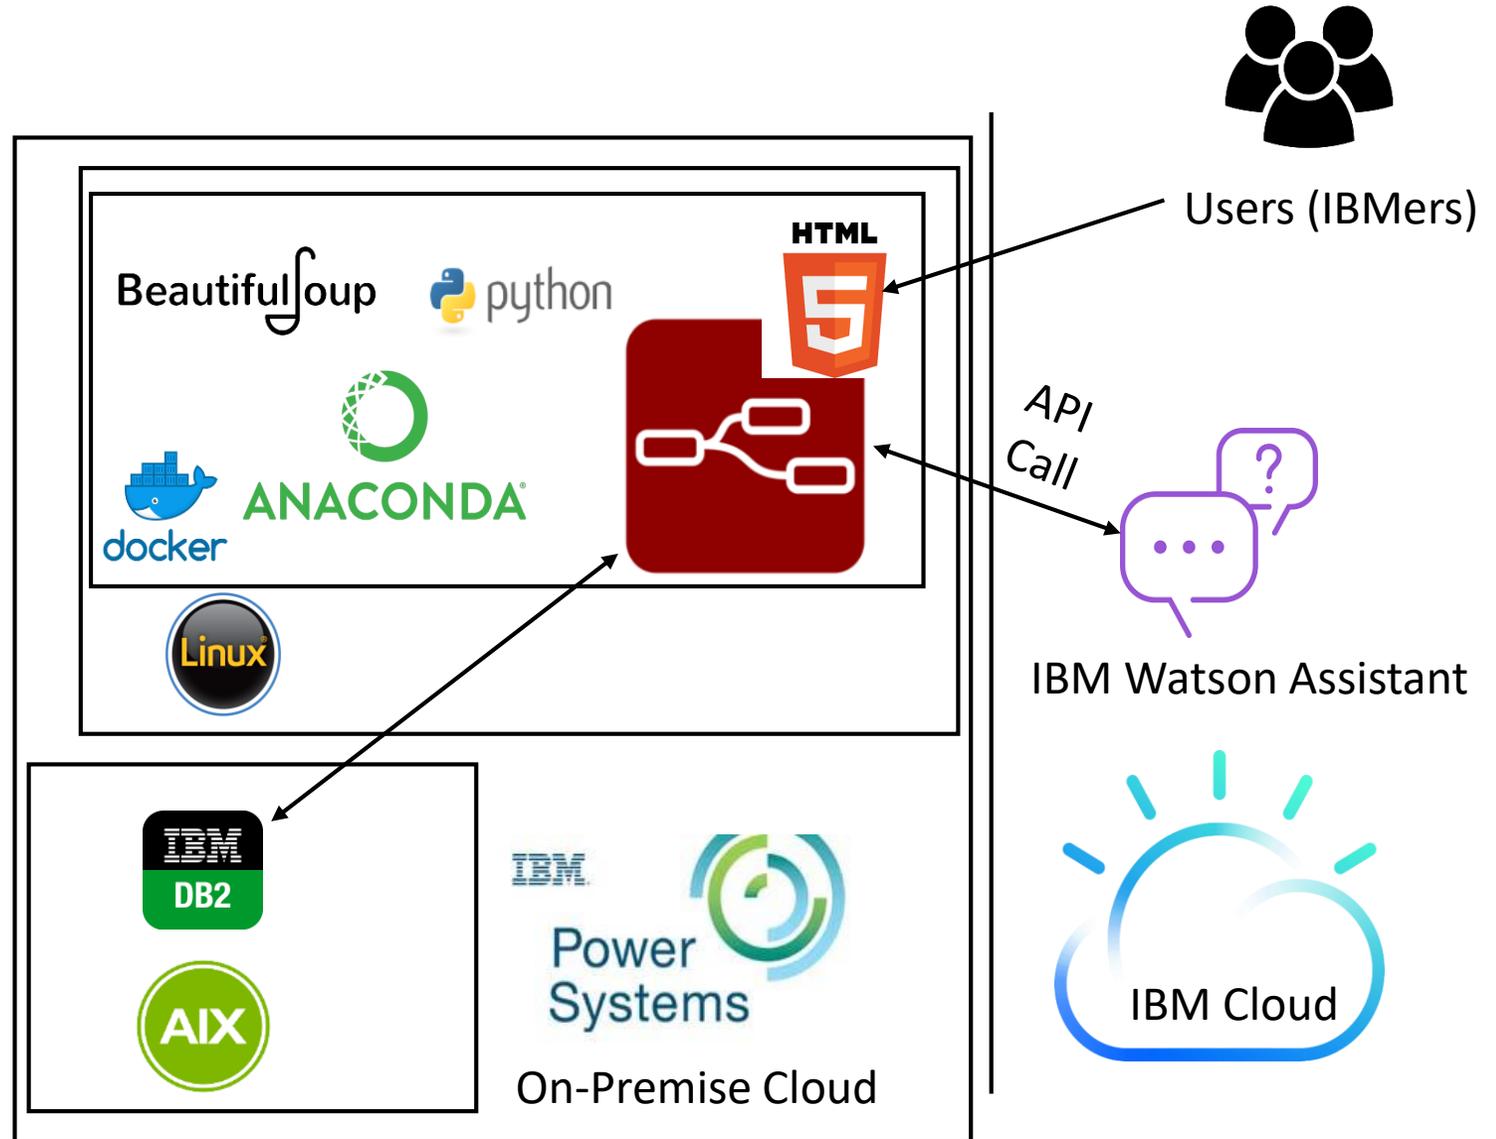

<https://www.imdb.com/interfaces/>

The high level recipe for the James Bond Assistant

Another Hybrid Cloud solution with AI

- IBM Db2 running in AIX
- Docker Container on Centos on IBM Power
- Anaconda to handle compatibility issues
- Node-RED calls
 - Watson Assistant
 - Python
 - BeautifulSoup
 - Urllib
 - DashDB
- Users interact with a webpage, which is part of Node-RED

Bringing in a key ingredient

Another new area to me, but standard for most AIX and IBM i implementations, was to get my database installed in the server, populated and accessible from my Container.

This may be a new technical skill for to me, but the idea is that almost all existing installs of IBM Power Systems have data like this already running. That data could be added to this kind of Hybrid Cloud solution.

What could you bake by mixing your existing data with new functions and other data sources?

Load the TSV files from IMDB initially into Db2 in the IBM Cloud, as it can help predict the schema details.

Then, LOAD, and find a lot of truncations. So, make the tables bigger and repeat!

Quite a lot of challenge getting the prerequisites for the Db2 CLI installed in the Container. Ross Cruickshank and Stuart Cunliffe helped me around those issues

```
FROM ppc64le/centos

RUN yum -y install libstdc++ make gcc-c++ numactl-devel
RUN curl -sL http://public.dhe.ibm.com/software/server/POWER/Linux/xl-compiler/eval/ppc64le/rhel7/libxlc-16.1.1.3-190404a.ppc64le.rpm > libxlc-16.1.1.3-190404a.ppc64le.rpm \
  && yum -y install ./libxlc-16.1.1.3-190404a.ppc64le.rpm
RUN cd /usr/local \
  && curl -sL https://nodejs.org/dist/v8.16.1/node-v8.16.1-linux-ppc64le.tar.xz > node-v8.16.1-linux-ppc64le.tar.xz \
  && tar --strip-components 1 -xf node-v8.16.1-linux-ppc64le.tar.xz
```

Simple icing this time

This version of IBM Watson Assistant is really simple. I created an Intent for each “function”, with minimal Dialog nodes to capture basic Entities/variables

IBM Watson Assistant

Bond Film Data Finder

Intents

Entities

Dialog

Options

Analytics

Versions

Content Catalog

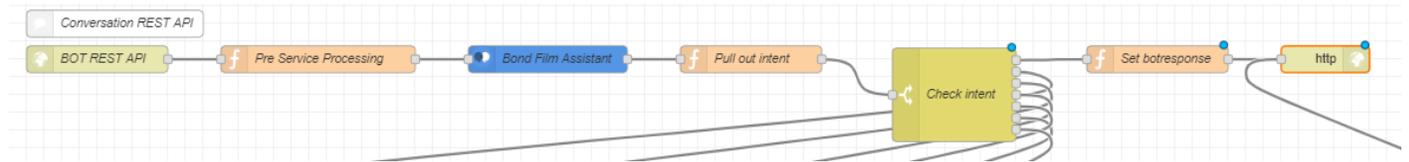

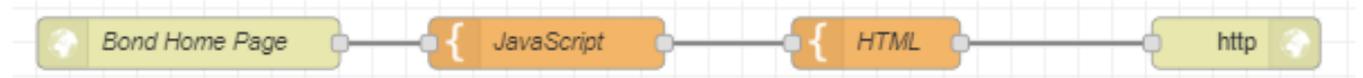

Create intent

<input type="checkbox"/>	Intents (7) ▲	Description
<input type="checkbox"/>	#Greeting	
<input type="checkbox"/>	#List_Bond_Girl_Actresses	List the actresses who have played "Bond Girls", where the Bond Girls are defined and listed by Wikipedia
<input type="checkbox"/>	#List_Canon_Bond_Films	List the official list of cannon Bond Films, as shown on the webpage "Pocket Lint"
<input type="checkbox"/>	#List_Career_History	Show the career history of an actress or actor
<input type="checkbox"/>	#List_Career_History_For_All	List the Career Histories for all the actresses in all the Bond Films
<input type="checkbox"/>	#List_Films_With_Character	List the films with a given character appearing in them
<input type="checkbox"/>	#List_Principals_In_Film	List the Principal Actor or Actresses in a given Bond Film

Repeated ingredients

I mostly reused the same couple of nodes to give me my web page.

Then, grab the input, save some values, pass to IBM Watson Assistant to work out the Intent. Check for that Intent, and return to the webpage if just saying “Hello”...

Cooking up the first “question” I want to ask

For AIX, using the DashDB node, I can pass SQL queries very easily.

The connection details for the DB are entered, then SQL can be called.

For Db2 for i, you need to pass the SQL to the Db2 for i node, which is very similar.

Properties

Service	External dashDB or DB2 instance
Server	AIX Db2 IMDB
Query	<pre>select primaryTitle from title_basics a, title_principals b where a.tconst = b.tconst and characters=['James Bond']</pre>
Parameter Markers (optional)	params
Name	Extract films with character James Bond

Using Python and BeautifulSoup again to enrich existing data

Using the Intent from IBM Watson Assistant, I reused some Python and BeautifulSoup to scrape a list of the official Bond Films.

Also, a recent addition is to use a Template node to pass HTML back to my page, to simply format my results.

Properties

Name:

Property:

Format:

Template Syntax Highl

```
1 {{#payload}}
2 <br>{{.}}
3 {{/payload}}
```

Trying out new methods

Ross Cruickshank recently showed me some new ways to format the results, which look much better.

In my Javascript template node, I had this:

```
// creates div for interaction with bot function  
createNewDiv(who, message) { var txt = who + ' : '  
+ message; return $('<div></div>').text(txt);
```

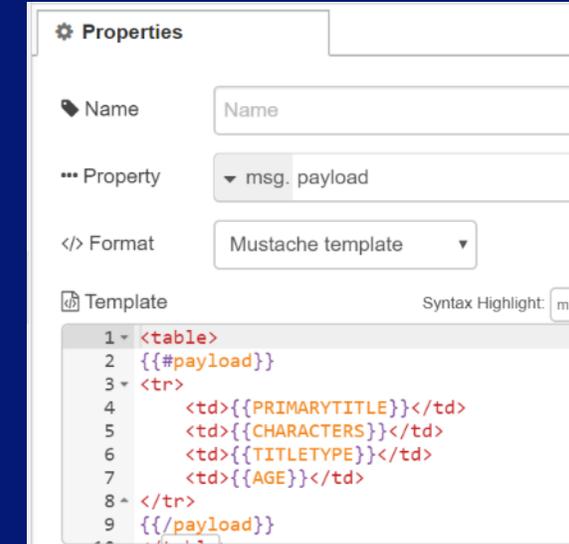

Which we changed to:

```
// creates div for interaction with bot function  
createNewDiv(who, message) { var txt = who + ' : '  
+ message; return $('<div></div>').html(txt);
```

Initially, the template for the webpage just accepted text.

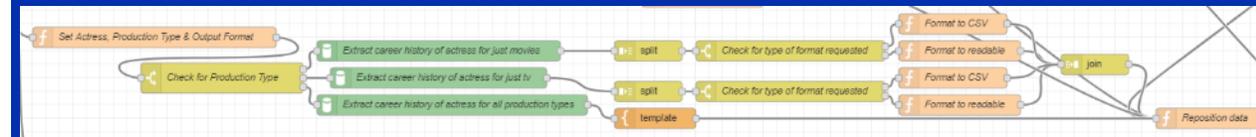

But, by changing to accept HTML, both text and HTML can be passed and displayed in the results

Passing a table format

Using Slots in IBM Watson Assistant, I can change if we want to display career histories for just Films, just TV, or both, which is the default. I was also checking for CSV or “human readable” in the question.

Just text, a table, or a CSV file are all possible.

A slice of James Bond Assistant

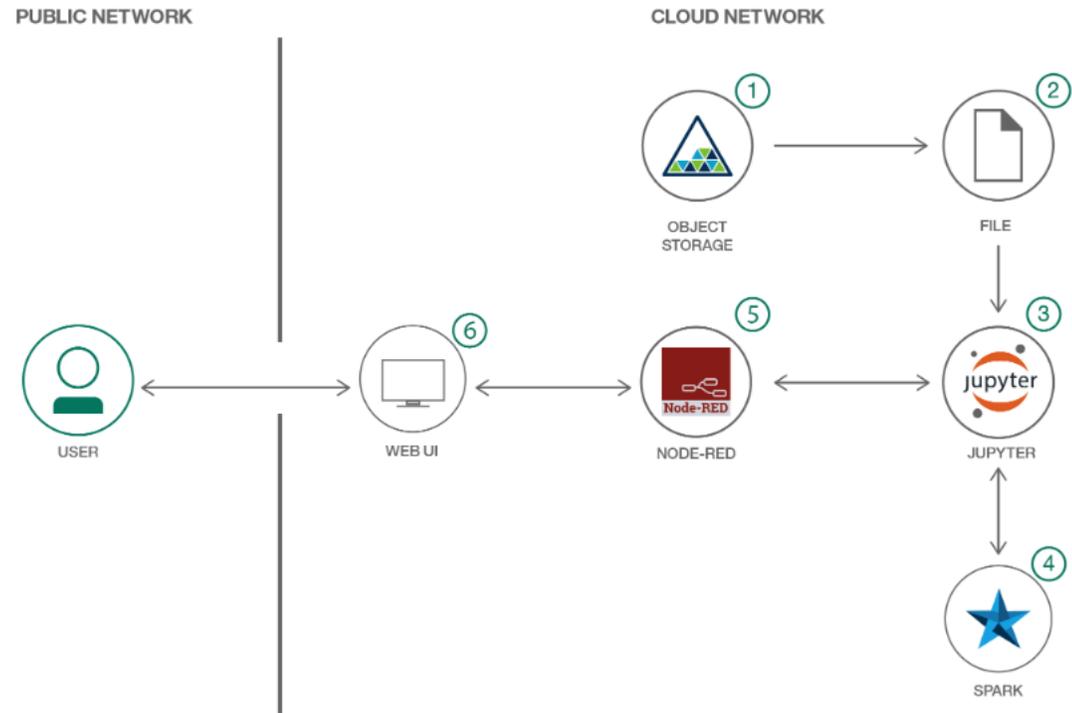

If you want to know more about this one, ask me!

More ingredients I want to work in

“Orchestration of the analytics workflow in IBM Watson Studio using a custom web user-interface built with Node-RED”

<https://github.com/IBM/node-red-dsx-workflow>

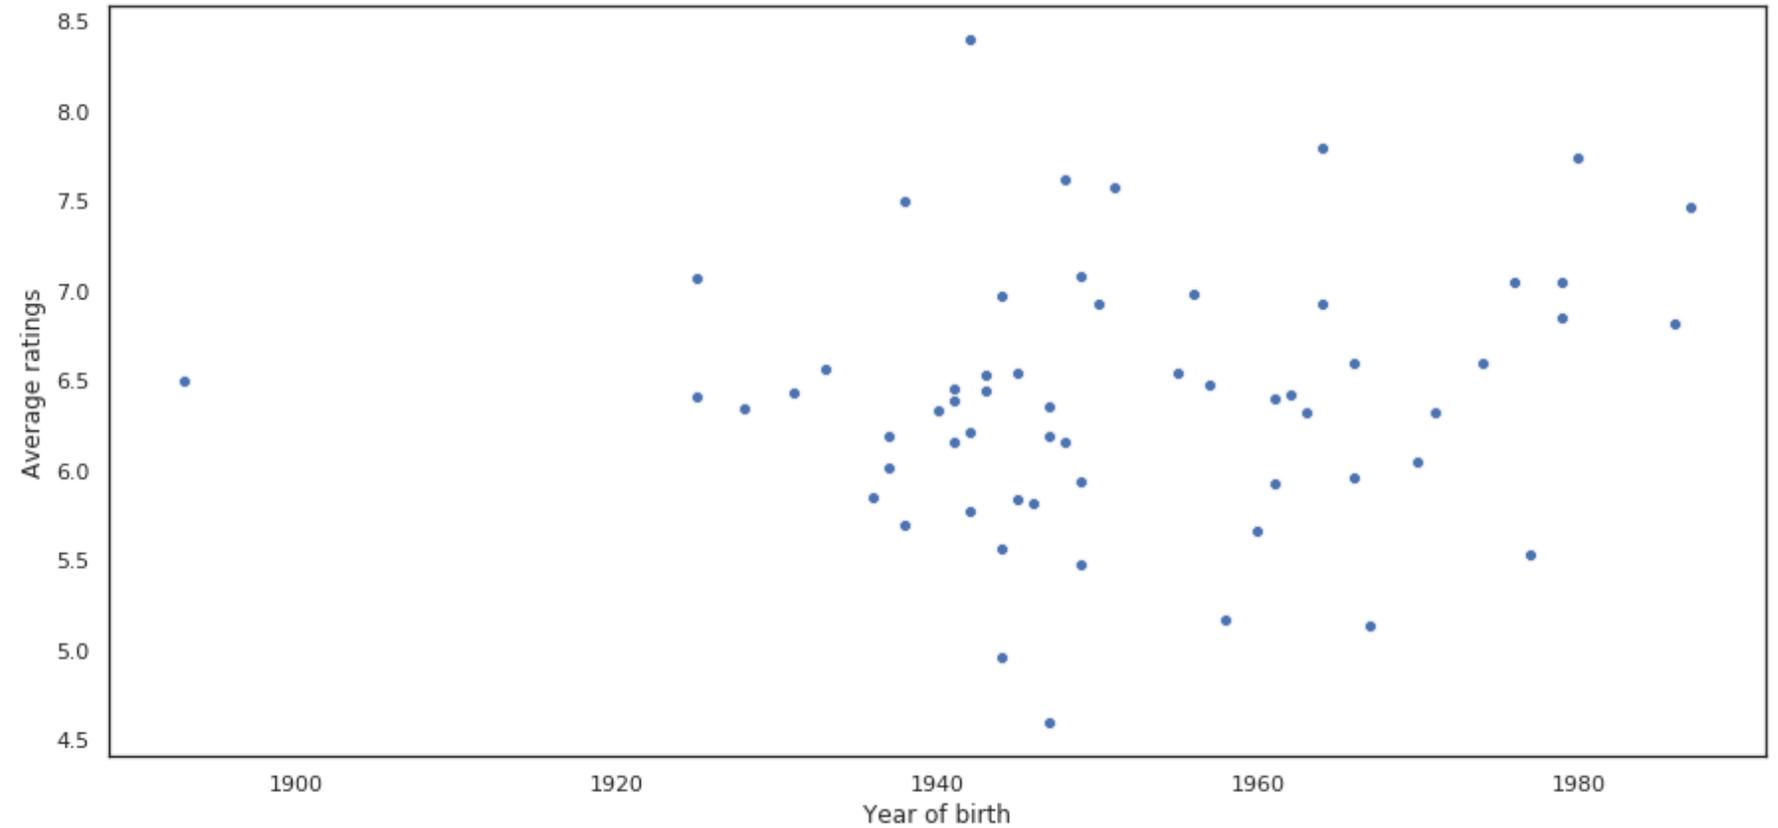

First taste of Data Science

My friend Mandie Quartly looked at whether Date of Birth had a correlation to rating of the film.

This was done with IBM Watson Studio on IBM Cloud, which could be linked to directly in a Hybrid Cloud solution.

On-premise also an option.

Trying something new can lead to more ideas

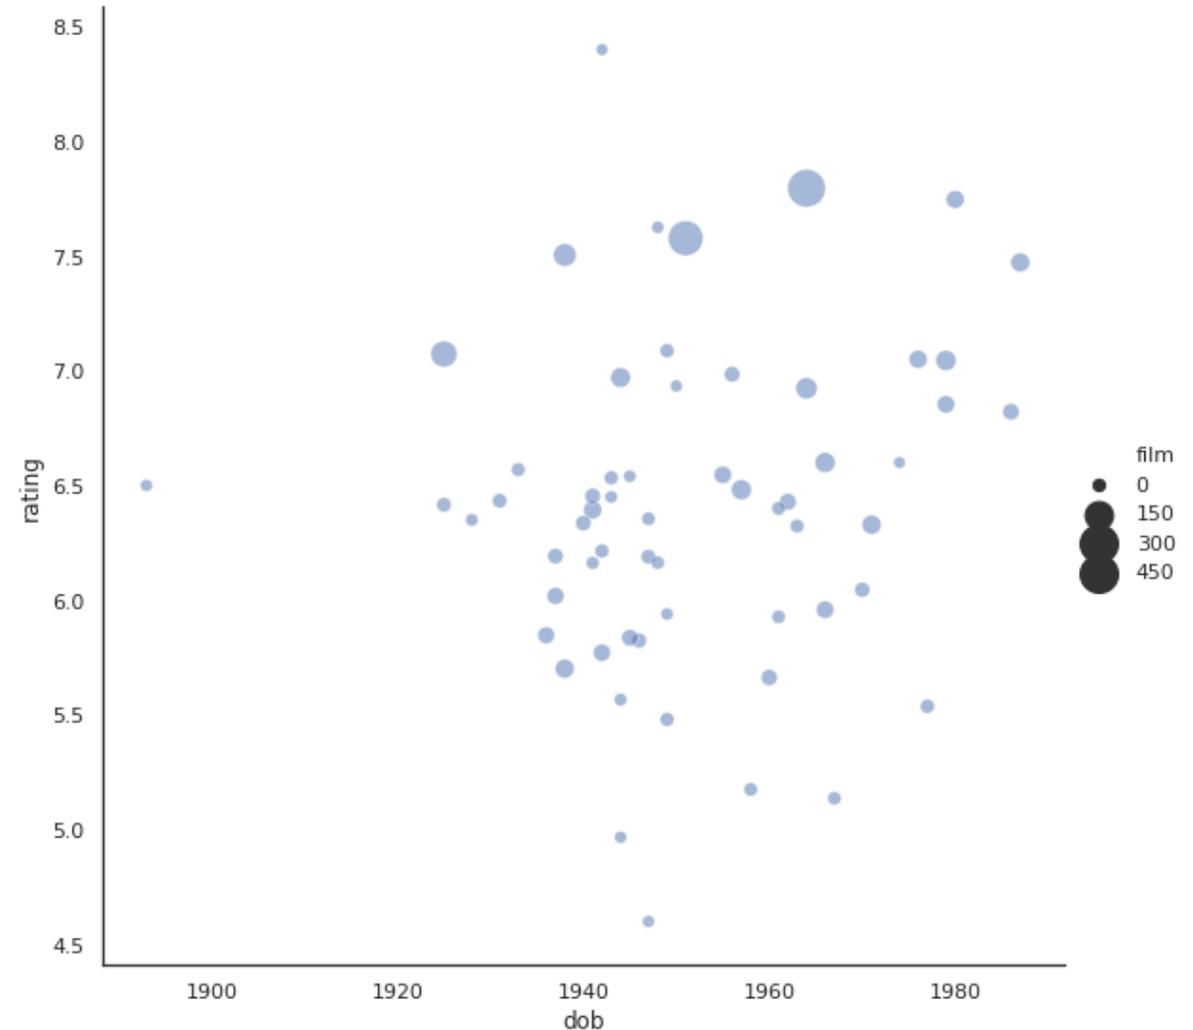

- One initial interesting result is that the more productions a “Bond Girl” has been in, the higher the “rating”.
- So, that might be a reflection on established experience, maybe?

```
In [63]: # Have Jane Seymour and Teri Hatcher really done that many films?  
ratings2[(ratings2.film > 200)]
```

Out[63]:

	name	dob	film	rating
26	Jane Seymour	1951.0	255	7.577647
55	Teri Hatcher	1964.0	302	7.795364

- Interesting catch: two of the actresses who had played “Bond Girls” had done a lot of other work
- This is because TV shows are also part of the data
- Teri Hatcher is in multiple episodes of Superman, Desperate Housewives and many more.
- Jane Seymour is similar, with Dr. Quinn, Medicine Woman after being a “Bond Girl”.

My first “Showstopper” is still to come

- My first creation is going down well. It answers a question I get asked, and so do others, so I plan to expand it and make it more widely available.
- Time can be saved!
- Next, the IBM Inventory Records is in a DB today...
- If I can take a version of that, combine my work with the Sales Manuals, I could tell which customers have servers which are going out of support and we could help with that issue.
- I have previously worked on TCO models. I may be able to combine that with the Inventory data, to show the benefits of upgrading, for a given customer.
- Maybe, going deeper into the Feature Codes, which Features have been announced to be Withdrawn from Marketing, so we can help there too.
- Other possibilities include integrating with Slack, so BPs and maybe others could benefit from my creation.

What could you cook up?

Could you create something that enhances existing AIX or IBM i solutions?

Don't let existing data become legacy!

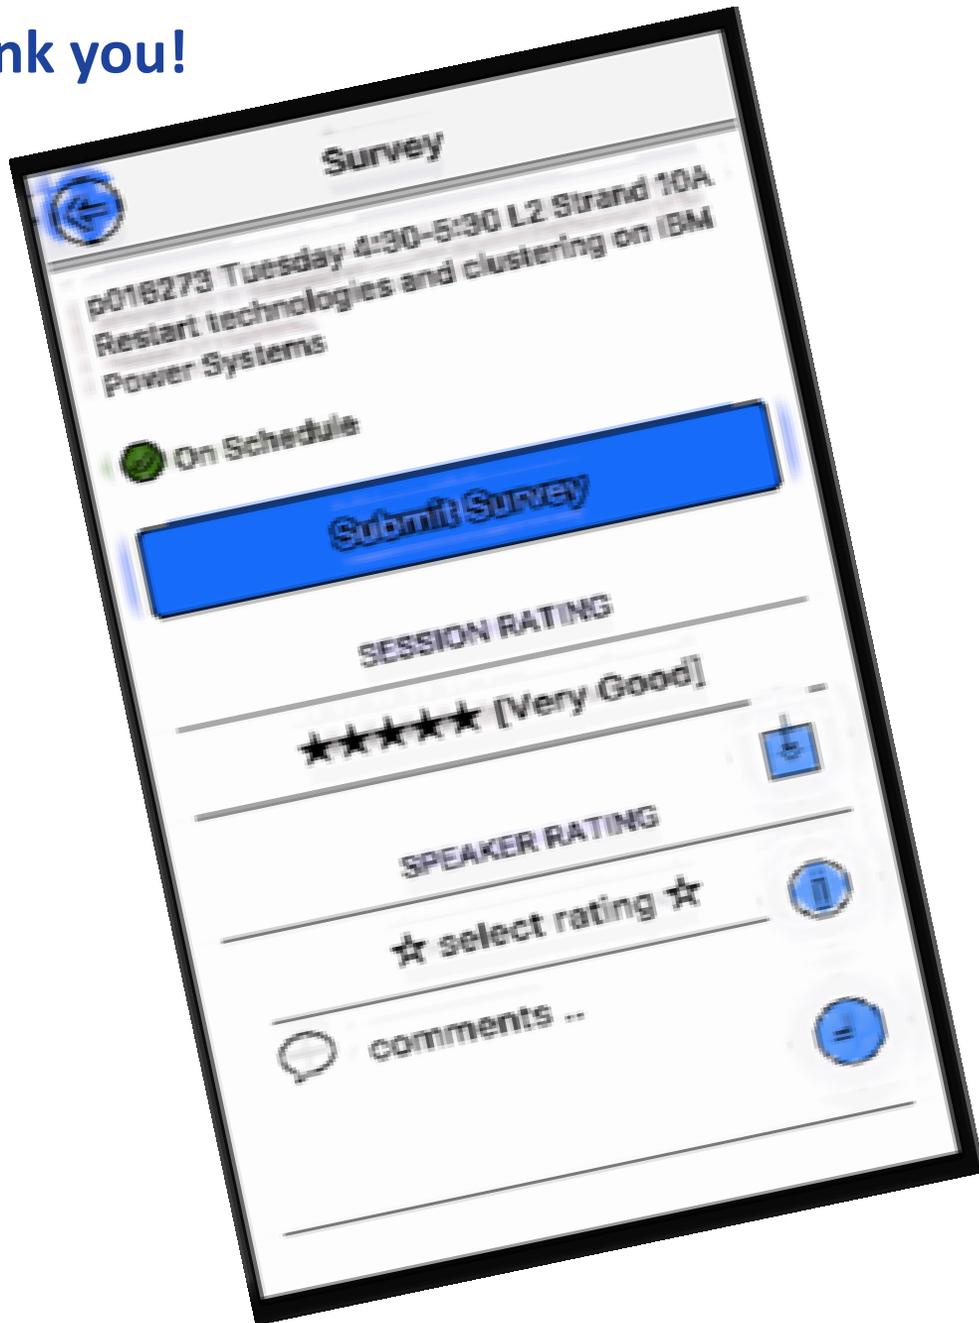

You don't need to be an expert to combine AIX or IBM i data with a Conversational Interface built with AI, and create tasty results!

Session summary

- You don't need to be an expert to do this. Anyone can cook with these ingredients!
- What started me on this journey and initial learning you can also use.
- My first creation was to answer a Frequently Asked Question. What FAQs do you see?
- The initial ingredients I used - Python, Beautiful Soup, Jupyter and Anaconda
- Lots of options available, so choose what works for you
- Node-RED is a powerful mixing bowl and IBM Watson Assistant can be the icing on the cake
- A quick taste of IBM Sales Manual Assistant
- My next bake brings in AIX, Db2 and James Bond!
- My first "Showstopper" is still to come
- What could you cook up?

Thank you!

David Spurway
